Problem: Making A Simple To-do List

In this exercise you are to make a simple To do list with the following conditions:

- There must be a **Task** class where the **to-do** list would have the following properties:
    - ID
    - Name of the task

    Write the required getters and setters and constructors as you think is necessary.

- There must be an **App** class that would have a **list of Tasks** . Think How you can implement this with an array.
    - The app class should have the following functionalities:
        - There must be a ***method*** to **show all the tasks of the todo list**.
        - There must be a ***method*** to **add a new task to the todo list**.
- There must be a **Client** class where the client would interact with the to-do list app we just made.
- You can make the menu **as a static method** for this purpose with the knowledge of **static methods** you studied.
